

From Fraud Desks to Founder

From Fraud Desks to Founder: My Story

The Unlikely Starting Point

I didn't start out writing code. I started out chasing numbers that didn't add up — sitting in banking fraud operations, learning to spot the pattern behind the pattern, the transaction that looked clean until you looked twice. That job taught me something I didn't fully appreciate at the time: systems have logic, and the interesting work is finding where the logic breaks.

From there I moved into telecom support, which sounds like a step sideways but was really an education in something else entirely — scale. Thousands of customers, hundreds of tickets, and the constant question of how you build a process that doesn't collapse under volume. Fraud taught me to look for patterns. Telecom taught me to build for them.

Somewhere in between, I picked up an MCA from Manipal University and a B.Sc. in IT — the formal grounding that made the informal pattern-recognition I'd been doing on the job actually make sense as computer science.

The Pivot Into Real Estate — and Into Marketing

Dubai's real estate industry is where I first got my hands on marketing as a discipline, not just a function. It's an industry that runs on lead volume, follow-up speed, and CRM discipline, or it runs on nothing. I learned HubSpot, I learned what a real sales funnel looks like when the stakes are a six or seven-figure property, and I learned that most of the "marketing automation" being sold to businesses at the time was neither automated nor particularly intelligent.

That frustration became the seed of everything that came after.

Teaching Myself to Build What I Couldn't Buy

I started learning to code seriously — not as a hobby, but as a way to solve the specific problem in front of me: businesses that needed real automation and couldn't get it from off-the-shelf tools. MERN stack first, then Next.js as my framework of choice once I understood what server-side rendering and the App Router could do for real client work. Tailwind, TypeScript, Sanity CMS, Vercel deployments — the stack that would eventually become FCodeLabs' technical backbone.

At the same time, I went back to formal learning again, but pointed at where the industry was heading — prompt engineering, GenAI, RAG systems. I wanted to understand not just how to build software, but how to build software that could reason, route, and respond intelligently. That combination — full-stack development plus applied AI — turned out to be exactly the right bet.

Building FCodeLabs

FCodeLabs started as a way to formalize what I'd already been doing informally: helping small and medium businesses in Dubai — real estate, F&B, beauty and wellness, ecommerce — get real web development and real automation, not templated websites and rented “solutions.” I built the brand with intention: a Neo-Brutalist identity, dark background, lime accent, Space Grotesk and JetBrains Mono typography. Nothing about it was accidental. I wanted the visual identity to say what the work does — precise, modern, a little unapologetic.

Getting the first client, Maihan Group, and the first proposal, Baz Properties, was the moment the business stopped being a side project and started being real. I set up proper invoicing, Brevo-compatible email infrastructure, a full cold outreach system in Kit.com with industry-specific sequences and WhatsApp deep links for the UAE market. Every piece of that infrastructure exists because I hit the problem myself first and built the fix.

Now I'm rebuilding the FCodeLabs website itself to Awwwards submission quality — an eight-phase redesign with GSAP and Lenis-powered animation, glassmorphism, magnetic CTAs, a full motion system. It's the site becoming the proof of what the agency can do, not just a page describing it.

The Danube Properties Chapter

While building FCodeLabs, I also stepped into Danube Properties as a Customer Service Advisor — a role that evolved, almost entirely through my own initiative, into a marketing automation and CRM operations position inside the Marketing Intelligence department. That evolution is probably the clearest evidence of how I work: given a support role, I found the automation problem hiding inside it and started solving it.

I built a lead pipeline workflow in n8n with full Salesforce CRM integration and relationship-manager assignment logic, and that work alone cut lead duplication by 80%. I built a production email classifier for an Outlook inbox — an AI routing agent running through OpenRouter and Claude, sorting messages across ten classification categories and forwarding to the right department automatically. I designed a complete six-stage GTM engine — lead capture, enrichment, scoring, routing, outreach, analytics — with Salesforce as the single source of truth, OpenRouter powering the AI layer, and Teams and Outlook handling notifications, with Google Sheets as a fallback layer underneath it all.

None of that was in my original job description. I built it because I could see the gap and I had the tools to close it.

The Side Projects That Keep Me Honest

Outside client and employer work, I run two YouTube channels — FactLabs, a Hindi-language 3D facts channel, and Films In Short, movie recap shorts. They're a different kind of practice: audience attention instead of client requirements, retention curves instead of conversion funnels. It's a reminder that the fundamentals of “does this hold someone's interest” apply whether you're building a CRM workflow or a sixty-second video.

I also built AssetTrak, a QR/RFID asset management SaaS concept, from a full PRD

through a series of build prompts aimed at enterprise clients — an exercise in thinking through a product from problem definition to go-to-market, not just execution.

Where I'm Headed

Right now I'm pursuing a GTM Engineer role at Easygenerator, a Dubai-based EdTech SaaS company — and it's not a stretch from where I've been, it's the natural next step. Everything I've built at FCodeLabs and Danube — the automation pipelines, the AI-routed workflows, the CRM architecture, the go-to-market thinking behind AssetTrak — is GTM engineering. I've just been doing it under different job titles, for smaller audiences, without the word "GTM" attached to it.

I picked up the Google Project Management Professional Certificate and an Agile Project Management course along the way, partly to formalize the project discipline I was already applying and partly because I've learned that the certificate matters less than the habit — I like knowing I built the underlying skill, not just the credential.

The Throughline

Looking back, the thread connecting fraud operations to telecom to real estate to FCodeLabs to Danube to Easygenerator isn't really about industries at all. It's this: I find the manual, broken, or missing process, and I build the system that should have existed in the first place. Fraud analysis was pattern detection without code. FCodeLabs and the Danube automation work are pattern detection with code, AI, and a full stack behind it.

I'm still doing the same job. I just have much better tools now.
